Subject: Wolverine Site; Rockford, MI - PFOA/PFOS Found in Res Wells

Hi Margaret,

PFOS detected in the residential wells are a result of a Wolverine World Wide (WWW) dump area (located west of town) and not the WWW site in downtown Rockford. The facility was a former shoe tannery. Results - 21 wells with verified results so far, 14 show some level of PFAS. The downtown facility was evaluated by the Site Assessment Program due to a community organization's petition. The site scored and in 2012, DEQ submitted a recommendation for "other cleanup authority" under the State Program. EPA agreed with DEQ's recommendation. DEQ and EPA discussed the dump but DEQ never included the site in the Site Assessment Program.

I spoke with Dave Kline this morning and he said the PRP is very responsive and they do not need EPA's assistance at this time.

If you have questions, please contact Nuria Muniz.
